

Mykola Zinchenko

AI Automation Engineer

Lead automation for marketing and lead generation agencies: n8n, Make, AI agents, APIs.

PROFILE

I build AI automations that capture and qualify leads, move data between the tools a business already pays for, and keep the team informed in real time. I design for systems that run unattended, so retries, schema validation, monitoring and documentation are part of every build, not an extra. Every delivery comes with a short screen recording and plain notes, so a team can run the system without me.

EXPERIENCE

AI Automation Engineer

2026 to present · remote

Marketing company, United States

- Slack and Telegram bots used daily by the marketing team for reports and requests.
- Competitor ad research pipelines: scheduled scraping with Apify, video frame extraction and AI tagging of ad creatives into a structured database.
- Reporting on Supabase and SQL, with dashboards in Airtable and Tableau.
- Monitoring, alerts and retries across production workflows, so they run unattended.

Freelance Automation Developer

2024 to 2025

- CRM integrations with Make.com across ActiveCampaign, HubSpot and Google Sheets.
- Chatbots and AI agents in n8n with OpenAI and ManyChat: lead qualification flows, agents with memory and business tools.
- Web scraping and lead generation pipelines: Google Places business data, YouTube transcripts turned into PDF documents.

SELECTED PROJECTS

AI Lead Scoring Automation

[GitHub](#)

n8n · OpenAI · Google Sheets · Slack · Next.js

- Webhook intake, AI scoring returned as validated JSON with an automatic repair attempt, a row in a spreadsheet and an instant Slack alert for hot leads.
- Load tested under concurrent submissions: every lead is recorded exactly once, with no overwrites and no duplicates.

Gem Room, a match-3 game inside Telegram

[Play](#)

Telegram Mini App · Cloudflare Workers · D1 · JavaScript

- 90 levels in three worlds, daily rewards, friend invites, payments in Telegram Stars.
- Game rules shared by the browser and the server, so every result is checked server side. A separate test copy keeps releases safe.

npm packages inside the n8n Code node

[GitHub](#)

Docker · n8n · Node.js · Telegram

- A custom n8n image with packages baked in and the two sandbox variables that unlock them. Demo workflow: QR codes and a photo turned into a rotating GIF.
